

# Canine TTA Report

11:34:57

SampleOwner / SampleDog / 19-Jan-2024

The Tibia Tuberosity Advancement (TTA) is one measurement made to help assess whether this stifle might benefit from the TTA procedure. If the measured advancement is large, the TTA procedure might be of benefit. Other stifle procedures might also be considered.

The TTA measurement for this stifle is 5.0 degrees and is indicated on the histogram to the left by the vertical black line. The green-colored region of the graph represents the 'normal' range.

The relative positioning of the bones of the stifle joint appear normal. This stifle probably would not benefit from the TTA procedure.
